

Full Spectral Simulations

Anu Dudhia

Approach

Atmospheric, Oceanic
& Planetary Physics,
University of Oxford

- ❖ Use MIPAS OFL L2 profiles plus IG data to define an atmospheric profile
- ❖ Run line-by-line model (RFM) to simulate full MIPAS spectra
- ❖ Compare with (apodised) L1B spectra (RFM-L1B)
- ❖ Aim is to investigate discrepancies *outside* microwindows
- ❖ Time consuming! (about 24 hours on an Alpha for one scan)

1 Scan

A band Residual Spectra

Radiance Contributions at 12km Tangent Height

3 Scans

A band Residual Spectra

Radiance Contributions at 12km Tangent Height

10 Scans

A band Residual Spectra

Radiance Contributions at 12km Tangent Height

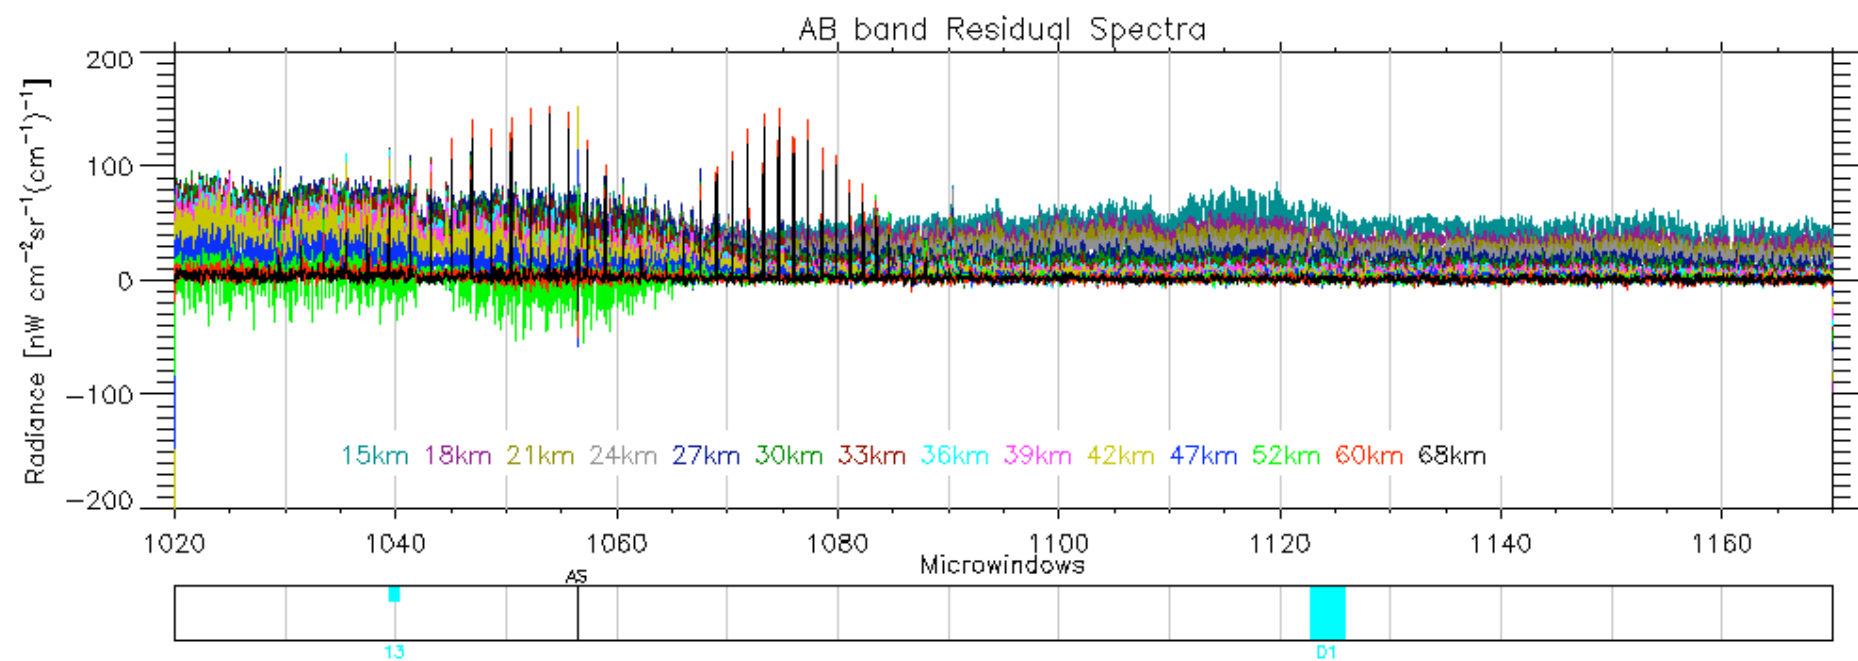

20 Scans

A band Residual Spectra

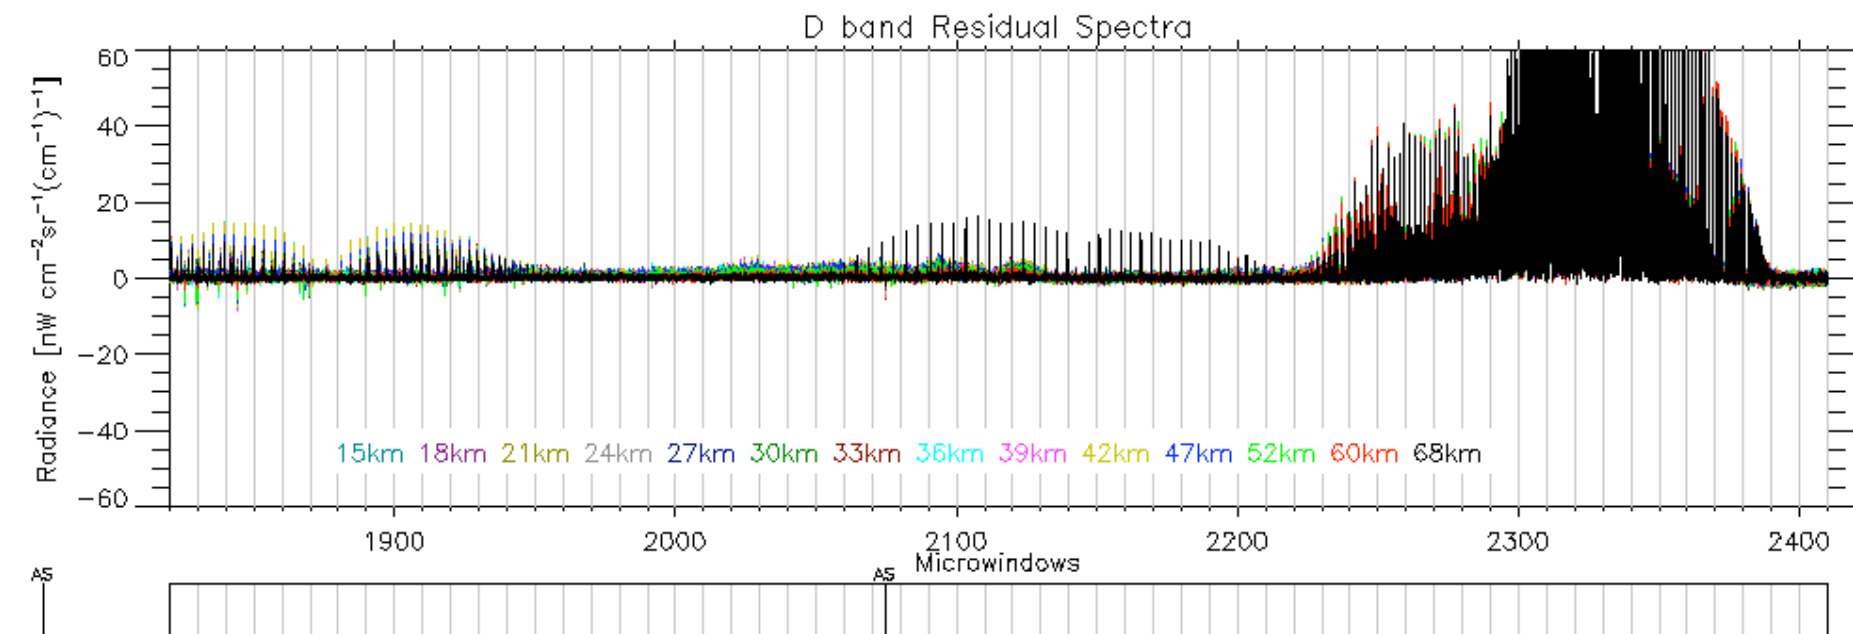

Future Work

Atmospheric, Oceanic
& Planetary Physics,
University of Oxford

- ❖ Complete simulations for full orbit
- ❖ Separate residuals by day/ngt and latitude
- ❖ Run REC analysis
- ❖ Repeat for ~1 orbit per month (or 1 day/month?)
